The First Presbyterian Church, built in 1837 in Gallatin, Tennessee, was severely damaged by fire in December of 2004. The fire, begun from a Christmas decoration candle on a window sill, burned up the side wall of the church, across the ceiling, into the organ chamber, and through the roof of the building. While partly damaged, the Egyptian Art Deco styled organ case survived the fire, along with some pipes from the electro-mechanical organ. The new mechanical action instrument, built by Bradley Rule of New Market, Tennessee, has electric stop controls and a detached console. Room acoustics were enhanced with a coffered detail on the ceiling, reinforced gypsum board walls, and a reduction in the amount of carpet in the space.
